PT Pine Bed Slats

Programmed Timber supports the efficient operation of their customers' businesses by providing real value benefit solutions.

Bed slats come in a range of variety and sizes from both domestic and overseas supply.

Why Programmed Timber is a beneficial bed slat producer.

All PT Bed Slats are produced in our Western Sydney processing facility where we have control over the grading and quality.

By combining Australian grown fibre with the most efficient processing and grade certainty, customers are guaranteed satisfaction without shipping delay or other backlogs.

With high speed precision docking and flexible production runs, each bed producer or importer can be easily accommodated. Each individual customer's needs are met either webbed or bundled.

With twice weekly supply to most areas, length and volume orders against customer requirements are easily fulfilled.

PT Bed Slats are individually graded using the world's best scanning technology available for this application.

The PT Bed Slat grade has always been of the highest order and continually improves to meet final customer's growing expectations for being solid and strong.

Additional service options include hole drilling, product identity labelling, bar coding and customer name/logo branding.

The plantation softwood resource used in all PT Bed Slats is from managed forests making them the most ecologically sustainable product on the market.

Imported bed distributors benefit from the local bed slat supplementation as this frees up container space and cash flow.

What you can rely on.

- A local committed experienced supplier of a quality product.
- 100% fit-for-purpose product that meets all requirements ensuring length accuracy and prompt supply.

Specification

Material: ■ 100% Australian pine timber

Dimension: ■ 90x35
■ Other non-standard dimensions are available.

Length: ■ Precision docked (\pm 1mm).

Grading & Quality:

- PT Bed Slats are graded to ensure every piece is suitable for use in every application and will not detract from the overall bed quality.
- Care is taken so there are no top edge splinters that can potentially damage the mattress or cause injury when dressing the bed.
- Clean and unmarked timber enhances the appearance to provide the final customer with a strong satisfaction outcome.
- Holes can be drilled where required, either in all or some individual slats. Webbed sets may require certain end or intermediate slats hole drilled.

Bundling & Webbing:

- PT Bed Slats can be supplied in both bundled and unbundled formats.
- Pieces per bundle are made for the individual customer's requirement. Often this is in 5 or 6 pieces and 2 bundles per bed are required. If the customer prefers 1 bundle per bed (10 - 13 pieces usually) the weight of the bundle will require more material handling consideration.
- Webbed bed slats are also made to the customer's individual specification. A material webbing (not hession) material is used for improved performance.
