PT Pine Packaging & Pallets

Programmed Timber supports the efficient operation of their customers' businesses by providing real value benefit solutions.

The use of timber for packaging, crating and palletising is widespread due to its versatility and convenience. Programmed Timber produce a range of standard and non-standard products to ensure strong and efficient use of the natural resource.

What products does Programmed Timber produce.

PT is Australia's leading timber component producer. Part of the range of products fall into the packaging area.

- Various seasoned and unseasoned precision docked pallet bearers (including scalloped) and pallet tops.
- Bearers docked or in long length either ungrooved or grooved to accommodate strapping.
- Industrial grade timber in both long length or short docked pieces to suit the individual customer's requirements.
- Fabricated elements like 'U' frames for pipe products.

The plantation softwood resource used in all PT packaging products is from managed forests making them at least the most ecologically sustainable product on the market.

Both specialist pallet and packaging manufacturing companies and other industrial users of timber for their packaging needs are able to benefit from the PT capacity with modest to significant volumes of supply.

What you can rely on.

- A local committed experienced supplier of a quality product.
- 100% fit-for-purpose product that meets all requirements ensuring length accuracy and prompt supply.

How will using PT packaging, crating and palletising products improve my business?

Purchasing timber packaging products from Programmed Timber addresses the 3 primary elements of resource utilisation efficiency.

1. Material - The source material used in all PT products comes from managed domestic softwood plantations. By supplying a range to structural & other industries using a wide range of raw fibre options allows more options for a secure supply chain and better certainty of supply to all customers.
2. Capital - The Programmed Timber processing operation is of significant scale and volume throughput. The capital commitment made by Programmed Timber allows the production of timber products efficiently and be cost competitive.
3. Labour - Reducing the number of timber components produced in-house and replacing them with zero labour cost bought-in products from Programmed Timber will always reduce production cost.

Industrial, packaging and others reduce their cost of manufacture and increase production through better utilisation of the resources they already have.

Specification

-
- Material:**
- 100% Australian pine timber
 - Seasoned
 - Unseasoned
-
- Dimensions:**
- Standard and non-standard seasoned dressed product dimensions.
 - Sawn seasoned or unseasoned timber standard and non-standard dimensions.
-
- Lengths:**
- Precision docked ($\pm 1\text{mm}$).
 - Long undocked lengths for the customer to cut to their varied requirements.
-
- Grading:**
- PT Pine Packaging is industrial grade plantation softwood sourced and processed for the purposes of withstanding packaging loads and handling.
 - Limited tolerances of wane (round back) allowance to ensure adequate surface faces for nailing or stapling.
